MILLIGAN AND MORGAN

It's a surgical procedure known as open predicl.

I) Advantages :

- *Technical ease,*
- *Reproducibility,*
- *Safety,*
- *This procedure treats both external and internal hemorrhoids.*

II) Disadvantages :

- *These disadvantages are associated with open procedure :*
- *3 incisions are left open leading to considerable oozing thus often a longer healing time,*
- *This procedure requires rigorous topical care,*
- *Risk of bleeding when scabs fall off,*
- *We leave in place 3 ligated pedicles leading to oozing causing painful inflammation,*
- *The pedicles will necrose and attach themselves to the walls of the anal causing the rectal mucous membrane to retract with a significant risk of stenosis especially if the pedicle ligature has been made too high in the rectal mucous membrane,*
- *Extensive intraductal cuts exist despite the presence of persistent mucocutaneous bridges,*
- *This procedure has the disadvantage of not treating mucosal prolapse in the lower rectum and neglecting a previous rectocele, which cannot be fully treated during the same surgical procedure.*
